*This document is part of the *Linear Algebraic Representation with CoChains* (LAR-CC) framework [**?**]. January 8, 2014

1 Basic representations

A few basic representation of topology are used in LARCC. They include some common sparse matrix representations: CSR (Compressed Sparse Row), CSC (Compressed Sparse Column), COO (Coordinate Representation), and BRC (Binary Row Compressed).

1.1 BRC (Binary Row Compressed)

We denote as BRC (Binary Row Compressed) the standard input representation of our LARCC framework. A BRC representation is an array of arrays of integers, with no requirement of equal length for the component arrays. The BRC format is used to represent a (normally sparse) binary matrix. Each component array corresponds to a matrix row, and contains the indices of columns that store a 1 value. No storage is used for 0 values.

BRC format example Let $A = (a_{i,j} \in \{0,1\})$ be a binary matrix. The notation `BRC`(A) is used for the corresponding data structure.

$$A = \begin{pmatrix} 0,1,0,0,0,0,0,1,0,0 \\ 0,0,1,0,0,0,0,0,0,0 \\ 1,0,0,1,0,0,0,0,0,1 \\ 1,0,0,0,0,0,1,0,0,0 \\ 0,0,0,0,0,1,1,1,0,0 \\ 0,0,1,0,1,0,0,0,1,0 \\ 0,0,0,0,0,0,0,0,0,0 \\ 0,1,0,0,0,0,0,1,0,1 \\ 0,0,0,1,0,0,0,0,1,0 \\ 0,1,1,0,1,0,0,0,0,0 \end{pmatrix} \quad \mapsto \quad \texttt{BRC}(A) = \begin{array}{l} \texttt{[[1,7],} \\ \texttt{[2],} \\ \texttt{[0,3,9],} \\ \texttt{[0,6],} \\ \texttt{[5,6,7],} \\ \texttt{[2,4,8],} \\ \texttt{[],} \\ \texttt{[1,7,9],} \\ \texttt{[3,8],} \\ \texttt{[1,2,4]]} \end{array}$$

1.2 Format conversions

First we give the function `format` to make the transformation from the sparse matrix as a list of triples *(row,column,value)* for each non-zero element, to the `scipy.sparse` format corresponding to the `shape` parameter, set by default to `"csr"`, that stands for *Compressed Sparse Row*, the normal matrix format of the LARCC framework. @d From list of triples to scipy.sparse @def format(triples,shape=”csr”): n = len(triples) data = arange(n) ij = arange(2*n).reshape(2,n) for k,item in enumerate(triples): ij[0][k],ij[1][k],data[k] = item return scipy.sparse.coo$_m atrix((data, ij)).asformat(shape)@@dBrctoCootransformation@defcooCreateFrom$
